Skills

Backend: C#, C++, Java, Python, NestJS, TypeORM

Frontend: React, Typescript, HTML, CSS, Javascript, TailwindCSS

Tools & Other: Git, Linux, Docker, Bash, Solidity, SQL,

Introduction

I am a Software Engineer specializing in backend architecture and scalable database design. Proficient in building secure RESTful APIs using C# and ASP.NET Core, with hands-on experience migrating legacy data to modern SQL Server schemas. I am also adept at integrating full-stack solutions with React and TypeScript, with a growing focus on application security and secure data handling.

Professional Experience

Fullstack Developer intern, Binder Manufacturing Hungary Bt.

July 2025 – September 2025

- Designed and implemented a full-stack leave-management system using C# ASP.NET 8, React, TypeScript, and Tailwind CSS.
- Migrated data from an older legacy database into a newly designed Microsoft SQL Server schema to ensure consistency and long-term maintainability.
- Tested the system end-to-end to validate functionality, performance, and cross-stack integration.
- Containerized the application with Docker and deployed it on a local server for internal use.

Projects

Encrytext

[Project]

Tech Stack: C#, ASP.NET 10, Terminal GUI

- Designed and implemented a peer-to-peer messaging system eliminating centralized servers, improving privacy and resilience.
- Built end-to-end encryption to ensure that only communicating users can read messages, securing data in transit.
- Developed a terminal-based user interface using Terminal GUI, enabling lightweight, cross-platform interaction without a traditional graphical UI.
- Implemented local network communication for real-time messaging between clients, including connection handling and message synchronization.
- Architected a modular backend in C# with ASP.NET, focusing on maintainability and extensibility for future networking or encryption upgrades.

Blockchain-based voting system

[Project]

Tech Stack: C#, ASP.NET 9, React, Typescript, HardHat, Solidity

- Created a full-stack blockchain based voting platform, handling both the system design and the full implementation lifecycle.
- Built the backend using ASP.NET 9 (C#), implementing secure endpoints, authentication flows, and election-management logic.
- Implemented the hardhat blockchain layer, deploying smart contracts to ensure voting transparency, immutability, and tamper resistance.
- Developed the client-side application with React, TypeScript, and Tailwind CSS, focusing on usability, responsiveness, and clear voter interactions.
- I stored and maintained persistent data in a PostgreSQL database, including vote metadata, login information, and election configuration.

PTO Manager

[Project]

Tech Stack: C#, ASP.NET 8, React, Typescript

- We developed a comprehensive leave management solution to simplify time-off requests, replacing manual tracking with a streamlined digital lifecycle.
- Architected a RESTful API with ASP.NET Core, employing the Repository pattern to decouple business logic from data access and improve testability.
- Constructed a type-safe, responsive frontend using React and TypeScript, delivering a real-time dashboard for leave balance visualization and status updates.
- Implemented granular security policies using Role-Based Access Control, ensuring strict data isolation between employees, managers, and administrators.

Education

University of Pannonia, Faculty of Information Technology – Computer Science MSc	09/2026 - Present
University of Pannonia, Faculty of Information Technology – Computer Science BSc	09/2023 - 06/2026
Kossuth Lajos Secondary School, Mosonmagyaróvár	09/2019 - 06/2023
